LISTING OF THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

Please reconsider the claims as follows:

CLAIMS

- 1 1. (currently amended) A method for generating a composite EM field to carry a signal
2 to at least two terminals, the method comprising the step of directing energy in a plurality of
3 directions, the amount of energy directed in the direction of each of the terminals being a
4 function of the locations and acceptable receive strengths of at least two of the terminals,
5 wherein the direction is an azimuth direction, wherein an acceptable receive strength for a
6 terminal comprises an electromagnetic (EM) field strength at least as large as, but not
7 significantly larger than, the EM field strengths needed for that terminal to receive the signal
8 carried by the EM field; wherein
9 the directing step comprises the steps of:
10 determining for each one of the terminals an EM field that would have to be
11 generated for the one terminal in order to provide an acceptable receive strength thereat, the
12 determining taking into account the strength, at the location of the one terminal, of EM fields
13 previously determined for others of the terminals;
14 repeating the first determining step until the EM fields determined for the at least two
15 of the terminals provide an EM field strength for each of the at least two of the terminals that
16 is substantially equal to its adequate receive strength; and
17 determining the amount of energy to be directed in the direction of each of the
18 terminals based on the EM fields thus determined.

1 2. (cancelled).

1 3. (cancelled)

1 4. (currently amended) The method of claim 13, wherein:

514849-1

Serial No. 09/672,512

Page 3 of 14

2 each EM field being represented by one of a plurality of beam-patterns;
3 the first determining step comprises determining for each one of the terminals a beam
4 pattern that would have to be generated for the one terminal in order to provide an acceptable
5 receive strength thereat, the determining taking into account the EM field strength, at the
6 location of the one terminal, of beam-patterns previously determined for others of the
7 terminals; and
8 the repeating step comprises repeating the first determining step until the beam-
9 patterns determined for the at least two of the terminals provide an EM field strength for each
10 of the at least two of the terminals that is substantially equal to its adequate receive strength.

1 5. (original) The method of claim 4, wherein:
2 the beam-patterns being voltage beam patterns;
3 the acceptable receive strength being an acceptable receive voltage; and
4 the adequate receive strength being an adequate receive voltage.

1 6. (original) The method of claim 4, wherein one of a plurality of weight vectors
2 corresponds to each of the beam-patterns, and the second determining step comprises the
3 steps of:
4 determining a composite weight vector using the plurality of weight vectors, and a
5 null-filling factor;
6 determining a composite beam-pattern using the composite weight vector, the
7 composite beam-pattern representing the composite EM field; and
8 determining the amount of energy to be directed in the direction of each of the
9 terminals based on the composite EM field.

1 7. (currently amended) The method of claim 1 A method for generating a composite EM
2 field to carry a signal to at least two terminals, the method comprising the step of directing
3 energy in a plurality of directions, the amount of energy directed in the direction of each of
4 the terminals being a function of the locations and acceptable receive strengths of at least two
5 of the terminals, wherein the direction is an azimuth direction, wherein an acceptable receive
6 strength for a terminal comprises an electromagnetic (EM) field strength at least as large as,

Serial No. 09/672,512

Page 4 of 14

7 but not significantly larger than, the EM field strengths needed for that terminal to receive the
8 signal carried by the EM field;

9 wherein the directing step comprises the steps of:

10 determining for each one of the terminals an EM field that would have to be
11 generated for the one terminal in order to provide an acceptable receive strength thereat if
12 that one terminal was the only terminal that needed to receive the signal;

13 determining a scaling factor for each EM field such that each EM field, associated
14 with the at least two terminals, scaled by its scaling factor provides an EM field strength at
15 the location of each of these at least two terminals that is substantially equal to its adequate
16 receive strength;

17 scaling each EM field, associated with the at least two terminals, by its scaling factor;

18 and

19 determining the amount of energy to be directed in the direction of each of the
20 terminals based on the EM fields thus determined.

8. (canceled)

1 9. (original) The method of claim 1, further comprising the step of transmitting the
2 energy.

1 10. (currently amended) A transmitter operable to generate a composite EM field to carry
2 a signal to at least two terminals by directing energy in a plurality of directions, the amount
3 of energy directed in the direction of each of the terminals being a function of the locations
4 and acceptable receive strengths of at least two of the terminals, wherein the direction is an
5 azimuth direction, wherein an acceptable receive strength for a terminal comprises an
6 electromagnetic (EM) field strength at least as large as, but not significantly larger than, the
7 EM field strengths needed for that terminal to receive the signal carried by the EM field;
8 the transmitter further comprising a processor having a first mode of operation to:
9 determine for each one of the terminals an EM field that would have to be generated
10 for the one terminal in order to provide an acceptable receive strength thereat, the
11 determining taking into account the strength, at the location of the one terminal, of EM fields
12 previously determined for others of the terminals;

514849-1

Serial No. 09/672,512

Page 5 of 14

13 repeat the first determining until the EM fields determined for the at least two of the
14 terminals provide an EM field strength for each of the at least two of the terminals that is
15 substantially equal to its adequate receive strength; and
16 determine the amount of energy to be directed in the direction of each of the terminals
17 based on the EM fields thus determined.

1 11. (cancelled).

1 12. (cancelled)

1 13. (currently amended) The transmitter of claim ~~12~~10, wherein:
2 each EM field being represented by one of a plurality of beam-patterns;
3 the first determining comprises determining for each one of the terminals a beam
4 pattern that would have to be generated for the one terminal in order to provide an acceptable
5 receive strength thereat, the determining taking into account the EM field strength, at the
6 location of the one terminal, of beam-patterns previously determined for others of the
7 terminals; and
8 the repeating comprises repeating the first determining until the beam-patterns
9 determined for the at least two of the terminals provide an EM field strength for each of the
10 at least two of the terminals that is substantially equal to its adequate receive strength.

1 14. (original) The transmitter of claim 13, wherein:
2 the beam-patterns being voltage beam patterns;
3 the acceptable receive strength being an acceptable receive voltage; and
4 the adequate receive strength being an adequate receive voltage.

1 15. (original) The transmitter of claim 13, wherein one of a plurality of weight vectors
2 corresponds to each of the beam-patterns, and the second determining comprises:
3 determining a composite weight vector using the plurality of weight vectors, and a
4 null-filling factor;
5 determining a composite beam-pattern using the composite weight vector, the
6 composite beam-pattern representing the composite EM field; and

Serial No. 09/672,512

Page 6 of 14

7 determining the amount of energy to be directed in the direction of each of the
8 terminals based on the composite EM field.

1 16. (currently amended) The transmitter of claim 10, ~~further comprising a processor~~
2 ~~operable to wherein the processor operates in only one of the first mode of operation and a~~
3 ~~second mode of operation, in the second mode of operation the processor operable to:~~

4 determine for each one of the terminals an EM field that would have to be generated
5 for the one terminal in order to provide an acceptable receive strength thereat if that one
6 terminal was the only terminal that needed to receive the signal;

7 determine a scaling factor for each EM field such that each EM field, associated with
8 the at least two terminals, scaled by its scaling factor provides an EM field strength at the
9 location of each of these at least two terminals that is substantially equal to its adequate
10 receive strength;

11 scale each EM field, associated with the at least two terminals, by its scaling factor;

12 and

13 determine the amount of energy to be directed in the direction of each of the terminals
14 based on the EM fields thus determined.

17. (canceled)

1 18. (currently amended) An system comprising a transmitter operable to generate a
2 composite EM field to carry a signal to at least two terminals by directing energy in a
3 plurality of directions, the amount of energy directed in the direction of each of the terminals
4 being a function of the locations and acceptable receive strengths of at least two of the
5 terminals, wherein the direction is an azimuth direction, wherein an acceptable receive
6 strength for a terminal comprises an electromagnetic (EM) field strength at least as large as,
7 but not significantly larger than, the EM field strengths needed for that terminal to receive the
8 signal carried by the EM field.

1 19. (cancelled).

Serial No. 09/672,512

Page 7 of 14

1 20. (original) The system of claim 18, further comprising a processor coupled to the
2 transmitter, the processor operable to:

3 determine for each one of the terminals an EM field that would have to be generated
4 for the one terminal in order to provide an acceptable receive strength thereat, the
5 determining taking into account the strength, at the location of the one terminal, of EM fields
6 previously determined for others of the terminals;

7 repeat the first determining until the EM fields determined for the at least two of the
8 terminals provide an EM field strength for each of the at least two of the terminals that is
9 substantially equal to its adequate receive strength; and

10 determine the amount of energy to be directed in the direction of each of the terminals
11 based on the EM fields thus determined.

1 21. (original) The system of claim 20, wherein the processor being located in the
2 transmitter.

1 22. (original) The system of claim 20, wherein the system is a wireless communication
2 system having at least one MSC, and the processor being located in the MSC.

1 23. (original) The system of claim 20, wherein:

2 each EM field being represented by one of a plurality of beam-patterns;

3 the first determining comprises determining for each one of the terminals a beam
4 pattern that would have to be generated for the one terminal in order to provide an acceptable
5 receive strength thereat, the determining taking into account the EM field strength, at the
6 location of the one terminal, of beam-patterns previously determined for others of the
7 terminals; and

8 the repeating comprises repeating the first determining until the beam-patterns
9 determined for the at least two of the terminals provide an EM field strength for each of the
10 at least two of the terminals that is substantially equal to its adequate receive strength.

1 24. (original) The system of claim 23, wherein:

2 the beam-patterns being voltage beam patterns;

3 the acceptable receive strength being an acceptable receive voltage; and

Serial No. 09/672,512

Page 8 of 14

4 the adequate receive strength being an adequate receive voltage.

1 25. (original) The system of claim 23, wherein one of a plurality of weight vectors
2 corresponds to each of the beam-patterns, and the second determining comprises:
3 determining a composite weight vector using the plurality of weight vectors, and a
4 null-filling factor;
5 determining a composite beam-pattern using the composite weight vector, the
6 composite beam-pattern representing the composite EM field; and
7 determining the amount of energy to be directed in the direction of each of the
8 terminals based on the composite EM field.

1 26. (original) The system of claim 18, further comprising a processor coupled to the
2 transmitter, the processor operable to:
3 determine for each one of the terminals an EM field that would have to be generated
4 for the one terminal in order to provide an acceptable receive strength thereat if that one
5 terminal was the only terminal that needed to receive the signal;
6 determine a scaling factor for each EM field such that each EM field, associated with
7 the at least two terminals, scaled by its scaling factor provides an EM field strength at the
8 location of each of these at least two terminals that is substantially equal to its adequate
9 receive strength;
10 scale each EM field, associated with the at least two terminals, by its scaling factor;
11 and
12 determine the amount of energy to be directed in the direction of each of the terminals
13 based on the EM fields thus determined.

1 27. (original) The system of claim 18, further comprising an antenna operable to transmit
2 the energy.

1 28. (original) The system of claim 27, wherein the antenna is a phased-array antenna.

1 29. (original) The system of claim 18, the system being a base station and the terminals
2 being mobile terminals.

Serial No. 09/672,512

Page 9 of 14

- 1 30. (original) The system of claim 18, the system being a wireless communication system
- 2 and the terminals being mobile terminals.

31. (canceled)
